

Please amend the claims as follows:

1. (Currently Amended) A method for directly monitoring volatile compounds in a gas or vapor phase medium from a nucleic acid [[enzymatic]] polymerase chain reaction, during an accumulation cycle of the reaction, which comprises one or more nucleic acids, comprising the steps of:

attaching one or more volatile organic tags to said nucleic acid;

screening the medium during an accumulation cycle with a multisensor array so that more than one physico-chemical change of a gas or vapor phase of a nucleic acid is detected by the multisensor to provide detected information to produce at least one signal output;

transferring the signal output to a signal processing means responsive to differences in electromagnetic properties of the signal for generating a final output;

receiving the final output into a pattern recognition means sufficient to generate a measurement pattern of the information;

sorting the information in accordance with a set of class boundaries of the physico-chemical changes; and

monitoring sorted information representative of the identity and amount the one or more nucleic acids in the medium.

2-3. (Canceled)

4. (Previously Presented) The method according to claim 1, wherein the multisensor array comprises a semiconductor gas sensor.

5. (Previously Presented) The method according to claim 1, wherein the multisensor array comprises at least one metal oxide gas sensor.

6. (Previously Presented) The method according to claim 1, wherein the multisensor array comprises at least one conductive polymer sensor.

7. (Previously Presented) The method according to claim 1, wherein the multisensor array comprises at least one of a vibrating or a resonant micromechanical device.

9. (Previously Presented) The method according to claim 1, wherein the multisensor array comprises a mass spectrometer.

10. (Previously Presented) The method according to claim 1, wherein the multisensor array comprises an optical sensing probe.

12. (Previously Presented) The method according to claim 1, wherein the information comprises at least one of odorous or volatile chemical species characteristic of the presence of a nucleic acid.

13. (Previously Presented) The method according to claim 1, wherein at least part of the information detected by the multisensor array is a change in the concentration of a nucleic acid.

14. (Previously Presented) The method according to claim 1, wherein at least part of the information detected by the multisensor array is a change in at least one secondary product of the reaction

15-41. (Canceled)

42. (Cancel)

45. (Currently Amended) The method according to claim [[42]] 1 subsequently comprising the step of controlling the polymerase chain reaction.
